

Tasktop Announces Automation and Value Stream Integration Solution For Intland Software's codeBeamer ALM

Tasktop Integration Hub Automates Connections with More than 50 Applications that Govern Other Parts of Value Stream

VANCOUVER, BC, Nov. 14, 2017

[Tasktop](#), the leader in Value Stream Integration, today announced its support for [codeBeamer ALM](#), [Intland Software's](#) application lifecycle management (ALM) platform for complex and safety-critical product development.

With this new integration, organizations can automate the connections between codeBeamer and more than 50 applications that govern other parts of their value stream. This dramatically extends the list of integrations offered by the award-winning codeBeamer ALM.

vsoftware development and DevOps toolchain, enabling the flow of work, information and processes across the value stream. For example, using the Tasktop Integration Hub, critical information can now flow instantly between codeBeamer and JIRA, IBM tools, ServiceNow, Micro Focus, CA and dozens more. Tasktop users can now include codeBeamer ALM in their connected value stream networks to establish traceability across tools and support analytics and reporting initiatives.

codeBeamer ALM is an all-around ALM platform for traditional and safety-critical product developers with features covering the entire lifecycle. Seamless end-to-end

traceability and powerful features help ensure process maturity throughout the process of requirements management; variants management; software development; risk management; quality assurance and testing; and DevOps. The platform is widely used by enterprises that wish to reduce software development and compliance time and costs while enhancing product quality.

To support companies operating in a multi-tier development environment of multiple suppliers and engineering departments, this latest integration connects the various disciplines and processes involved in the development of embedded or standalone software products. Typical use cases include [requirements traceability](#) and [requirements-development alignment](#), bringing value to the entire business via connecting project managers and business analysts with testing and development teams. codeBeamer ALM helps safety-critical users achieve continuous compliance by automating process visibility and simplifying [lifecycle-wide reporting](#).

“This integration with Tasktop further bolsters codeBeamer ALM’s robust capabilities to unite all development streams,” said Janos Koppány, CEO of Intland Software. “We see a strong use case with automotive developers that need an integrated platform to manage their end-to-end development and compliance processes. Tasktop helps solidify codeBeamer’s position as the leading application lifecycle management tool at the confluence of these value streams.”

In multi-layered developments, automotive developers are struggling to maintain point-to-point integrations of highly specialized development tool stacks. This integration enables unparalleled collaboration, and helps harmonize a mixed tool ecosystem under an overarching feature set that covers the entire product lifecycle.

“As safety-critical physical products become more software-driven we are seeing an increasing need for the specialized ALM capabilities provided by codeBeamer,” said Neelan Choksi, president and COO at Tasktop. “The highest performing development organizations are also adopting DevOps practices that require a high degree of collaboration across disciplines and depend on automation provided by Tasktop. This collaboration with codeBeamer is a natural fit and we are excited to bring the combined solution to our customers.”

The Tasktop integration for codeBeamer ALM is available immediately. Register for an upcoming Tasktop Intland webinar: [How to Optimize Supply Chain Collaboration--The Road to a Unified Automotive Value Stream](#).

About Intland Software

Intland Software is the developer and vendor of codeBeamer ALM, a fully integrated end-to-end Application Lifecycle Management software platform. codeBeamer ALM is a scalable collaborative software tool used by global enterprises to manage complex product development processes. Its preconfigured templates help reduce the time and costs of development and compliance in safety-critical development. Follow @intland on Twitter, LinkedIn, or find out more at <https://intland.com/>.

About Tasktop

Over one million users employ Tasktop's Value Stream Integration technology to transform software development and delivery. Tasktop not only unifies the software development and delivery team, but also provides unprecedented visibility into the business critical processes of software delivery. Tasktop customers are the global leaders in financial services, insurance, government and manufacturing, and include 43 of the Fortune 100, 11 of the top banks in the world, six of the top six health plans and four of the top ten US insurance companies. Partners, including CA, Micro Focus and IBM, rely on our independent, vendor-neutral role to connect their customers' software delivery disciplines via OEM distributions of our products.
